

SEAL PROOF KELP

How to properly install the kelp and ensure that it will last in the exhibit

Pangea Rocks always recommend that few pieces of kelp are "tested" in the tank before installing the full amount. We suggest to install the kelp in "smaller" stones and only after to install them into the aquarium. If the kelp is installed directly into the tank decorations - the animals will be able to pull the kelp easily and damage the decoration.

- Find a small stone of 1-2 pounds.
- Use a small drill machine with a 8 mm.
- Hold the stone and drill the hole.
- Drill on a soft surface, to prevent the stone from breaking easily.

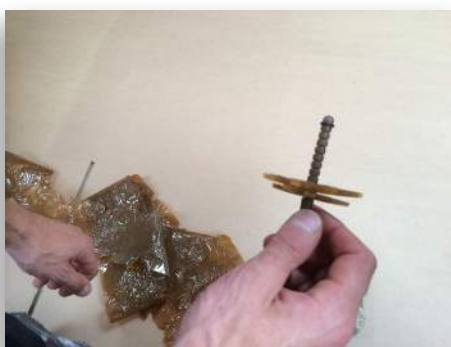

base **01**

- Install the 1.St root ring
- Install the 2nd root ring
- And the O-ring at the tip of the peg

install **02**

- Push the peg into the stone
- The O ring will then lock the kelp into the stone, you can also use silicone instead of the o-ring.

fix **03**

- The kelp is now installed into the stone and can safely be put into the tank

final **04**

The kelp can also be installed without the two root rings. It is important to keep the animals under observation during the first times to notice their reaction.
